

3. Choose Target Journal First

Why Important?
• Different format
• Different writing style
• Different reader type

Example:
Specialist Journal:
• Simple explanation
• Mixed readers

General Journal:
• Journal scope
• Research type preference
• Basic research

Also Check:
• Research type preference
• Basic research

4. Main Sections of Scientific Paper (IMRAD)

I → Introduction
M → Methods
R → Results
D → Discussion

Extra Parts:
• Title
• Abstract
• Tables
• Figures
• Acknowledgements

5. Primary & Secondary Endpoints

Purpose:
• Explain what was measured

Primary Endpoint:
• Main measurement/result

Secondary Endpoint:
• Additional measurements

Important:
• Clearly define all endpoints

6. Procedures & Materials

7. Ethical Consideration

9. Writing Style Tips

• Write clearly
• Keep logical order
• Use consistent terms
• Avoid unnecessary details

10. Tense Usage (Very Important)

Current Knowledge:
→ Present tense

Previous Studies:
→ Past tense

Hypothesis:
→ Present tense / Present perfect

Objective:
→ Past tense

Example:
• We aimed to measure...
• Previous studies showed...
• It remains unclear whether...

11. Final Key Idea

Good Methods Section:
• Clear
• Reproducible
• Organized
• Detailed consent
• Clinically trial registration (if needed)

5. Introduction Section

Main Goal:
• Grab reader attention
• Make reviewer interested

Introduction Should Answer:
• Why this study?
• What problem exists?
• Why important?
• What new thing added?

Strong Introduction Should:
• Explain problem
• Show research gap
• Prove importance
• Explain contribution
• State objective clearly

6. What To Include in Introduction

1. Existing knowledge
• Explain what already known

2. Research Gap
• Show what still unknown

3. Contribution
• Explain how study helps

4. Objective
• Mention research goal clearly

5. Strategy
• Briefly explain approach/method

Table 1 : Introduction Section Outline

1. Background
Purpose:
• Explain what is already known about the topic
Example:
• PCI is important for acute coronary syndrome treatment
• But complications may happen

2. Research Gap / Unknown Problem
Purpose:
• Explain what is still unknown
• Show controversy or missing knowledge
Useful Sentences:
• It remains unknown whether...
• To date, it has not been proven...
• No study has investigated...
• There are few data to quantify...
• The effect of ... remains unclear

3. Objective / Hypothesis
Purpose:
• Explain research goal clearly
Example:
• We hypothesized that ...

4. Measurement Parameter
Purpose:
• Mention what you will measure
Example:
• Blood pressure
• Accuracy
• Response time
• Survival rate

5. Patient Population / Context
Purpose:
• Explain study environment or participants
Example:
• Prospective study
• Multicenter study
• Observational study
• Interventional study

6. Secondary Objectives
Purpose:
• Mention additional small goals of study

5. Introduction Section

Main Goal:
• Grab reader attention
• Make reviewer interested

Introduction Should Answer:
• Why this study?
• What problem exists?
• Why important?
• What new thing added?

Strong Introduction Should:
• Explain problem
• Show research gap
• Prove importance
• Explain contribution
• State objective clearly

6. What To Include in Introduction

1. Existing knowledge
• Explain what already known

2. Research Gap
• Show what still unknown

3. Contribution
• Explain how study helps

4. Objective
• Mention research goal clearly

5. Strategy
• Briefly explain approach/method
